#### Class variables

Class variables in python are shared among all of the class instances.

- If you change the class variable with the class object (class.attr = value), the value is changed in all existing and future class instances (Dog.sound = 'yip').
- If you change the variable through a class instance (big\_dog.sound = 'growl') a local variable is created for that instance and added to the instance's dictionary.

```
class Dog:
    sound = "bark"

>>> print Dog.sound bark

>>> big_dog = Dog()

>>> small_dog = Dog()

>>> print big_dog.sound, small_dog.sound bark bark

>>> Dog.sound = 'yip'

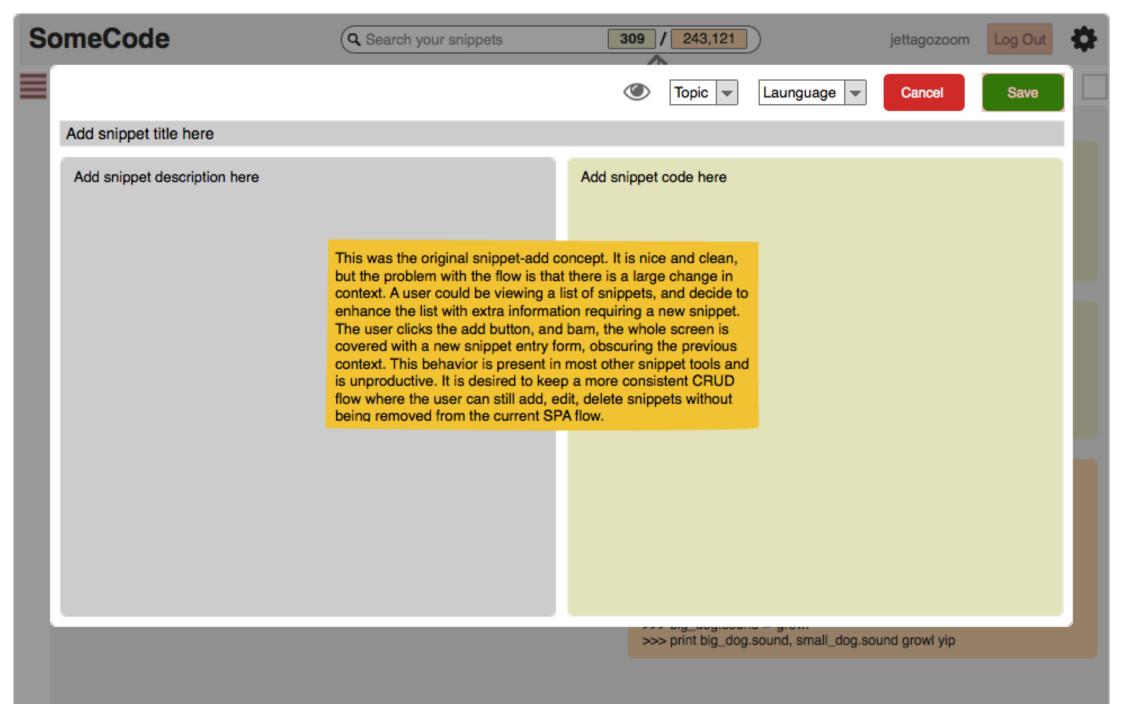

>>> print big_dog.sound, small_dog.sound yip yip

>>> big_dog.sound = 'growl'

>>> print big_dog.sound, small_dog.sound growl yip
```

public snippet

### Snippet attribute selector:

- The eye icon is set to "open" for public snippets, "closed" for private snippets
- If the snippet is owned by the current user, the snippet can be set to the public or private state
- The snippet will be added to the currently selected topic
- If no topic is selected, the snippet will be added to the "General" topic
